

# Closed Head Injury: Headache to Herniation

ANTHONY T. KRAMER  
UNIVERSITY OF CINCINNATI BLUE ASH  
EMS TECHNOLOGY PROGRAM

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

## Objectives

- Describe the pathological process of a closed head injury and increased intracranial pressure.
- Recognize the signs and symptoms of a closed head injury patient who is decompensating (herniating).
- Field treatment of a closed head injury patient.

Closed Head Injury (2014)

---

---

---

---

---

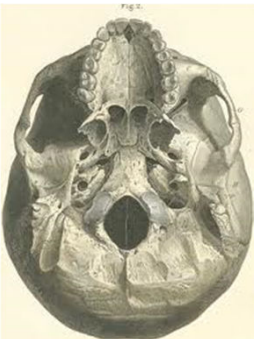

---

---

---

### Normal Anatomy

Skull  
Brain  
Meninges  
Dura Mater  
Arachnoid  
Pia Mater

---

---

---

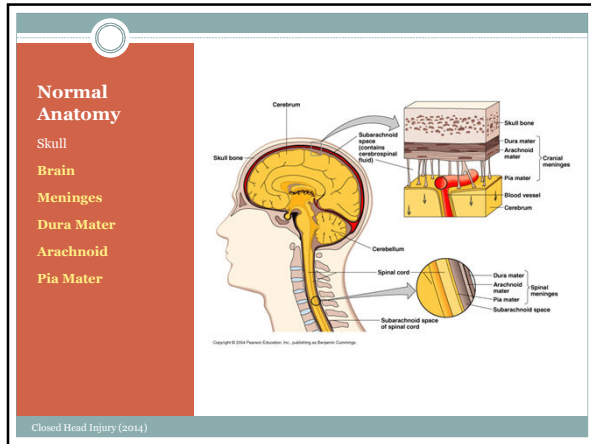

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### A Little Physiology (Very Little)

My Brain Needs	To Get O <sub>2</sub> and Glucose
<ul style="list-style-type: none"> <li>• Oxygen</li> <li>• Glucose</li> </ul>	<ul style="list-style-type: none"> <li>• I need perfusion</li> <li>• I need Cerebral Perfusion Pressure (CPP)</li> </ul> <p style="color: red; margin-top: 10px;">How do I get it?</p>

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

---

---

### Cerebral Perfusion Pressure

- I need blood flow with decent pressure
  - Blood Pressure
  - Mean Arterial Pressure (MAP)
  - MAP =  $\frac{\text{Diastolic} \times 2 + \text{Systolic}}{3}$
  - 70mmHg – 120mmHg is normal perfusion pressure for organs
- I have a consistent yet low Intracranial Pressure (ICP)
  - Approximately 10mmHg

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

---

---

### Cerebral Perfusion Pressure

CPP = MAP – ICP (minimum CPP of 60 – 70mmHg)

- If I keep a decent Blood Pressure my CPP is good.
- If I keep my ICP low my CPP is good.
- Mess with either of these and my brain suffers. ☹

For example:

- Drop my MAP below 60 – 70mmHg.
- Increase my ICP to greater than 20mmHg.

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### I've Got Gas

Oxygen (PaO <sub>2</sub> )	Carbon Dioxide (CO <sub>2</sub> )
<ul style="list-style-type: none"><li>• Normal: 80–100mmHg</li><li>• Get your PaO<sub>2</sub> &gt; 100mmHg and the blood vessels constrict</li><li>• Drop your PaO<sub>2</sub> and your blood vessels dilate</li></ul>	<ul style="list-style-type: none"><li>• Normal 35-45mmHg</li><li>• Drop your CO<sub>2</sub> and blood vessels vasoconstrict.</li><li>• Increase your CO<sub>2</sub> and vasodilate.</li></ul>

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### CPP Normal Compensation

Slight Rise in ICP	Gas
<ul style="list-style-type: none"><li>• Jump the B/P up slightly</li><li>• Maybe vasodilate some.</li></ul>	<ul style="list-style-type: none"><li>• Hyperventilate to get rid of carbon dioxide and vasoconstrict.</li></ul>

**Our body will do anything to keep the brain comfortable!**

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

**Important Stuff**

- Concussion
- Coup-Contrecoup
- Intracerebral hemorrhage
- Epidural hematoma
- Subdural Hematoma
- Increased ICP
- What to do in the field.

**Tony; "You only have 25 minutes to discuss the Important Stuff!"**

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Concussion

- **Somatic:** Loss of or change in consciousness.
- **Cognitive:** Felling in a fog
- **Emotional:** Changeability
- **Behavioral:** Irritability
- **Cognitive Impairment:** Slowed reaction times and/or sleep disturbances.
- **Ataxia, Headache,**
- **Negative Progression Process:** Lots of little's add up to major signs and symptoms.

○ NFL

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

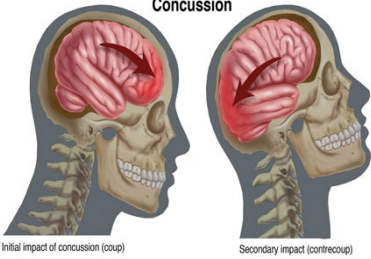

### Coup - Contra coup

Primary blunt trauma.

Does not describe the severity of injury, just the mechanism of cerebral impact.

Coup: Initial impact

Contra coup: recoil impact. Can be as severe as the coup.

**Concussion**

Initial impact of concussion (coup)

Secondary impact (contrecoup)

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Intracerebral Hemorrhage

- Mostly frontal and temporal lobes
- Subarachnoid / aneurysm
- Usually a medical incident but can be trauma

Closed Head Injury (2014)

---

---

---

---

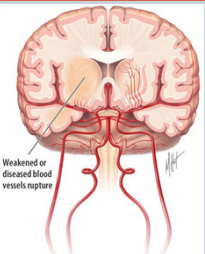

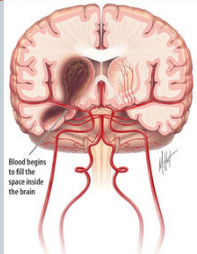

---

---

---

---

### Intracerebral Hemorrhage

Normal Anatomy	Bleed
 <p><small>Weakened or diseased blood vessels rupture</small></p>	 <p><small>Blood begins to fill the space inside the brain</small></p>

Closed Head Injury (2014)

---

---

---

---

---

---

---

**Middle Meningeal Artery**  
 (Supplies Skull and Dura Mater)

**On the Surface**      **Lacerated**

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

---

---

---

---

**Epidural Signs and Symptoms**

- Loss of Consciousness
- Lucid Period
- Maybe headache C/O
- Maybe nausea/vomicking
- Crash
- Rapid rise in ICP
  - We will get to this!
- Seizure
- Posturing
  - Decorticate (Flexion)
  - Decerebrate (Extension)
- Need to relieve pressure!

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

---

---

---

---

Beneath the Dura mater.  
 Venous bleed  
 Bridging veins  
 Acceleration/Deceleration  
 Jarring injury  
 More injury to brain tissue  
 Acute or Chronic  
 Acute (within 48 hours)  
 Chronic (>48 hours, days, weeks, month)

**Subdural Hematoma**

Closed Head Injury (2014)

---

---

---

---

---

---

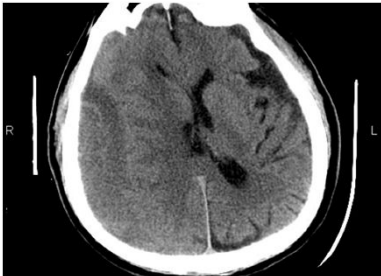

---

---

**Signs and Symptoms**

**Acute**  
 Altered LOC  
 Steady decline  
 Increased ICP  
 Hemiparesis/Hemiplegia  
 Fixed pupils

**Chronic**  
 Headache  
 Progressive decreased LOC  
 Ataxia  
 Incontinence / Seizure  
 Axonal / Focal Brain Injury

**Subdural Hematoma**

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

**Closed Head Injury**

**Frontal**                      **Frontal**

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Closed Head Injury

**Frontal**

Closed Head Injury (2014)

**Temporal**

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Intracranial Pressure

- $CPP = MAP - ICP$
- The ICP elevates either slowly (subdural) or rapidly (epidural) or somewhere in between.
- Why they are sick doesn't matter to us!

Closed Head Injury (2014)

---

---

---

---

---

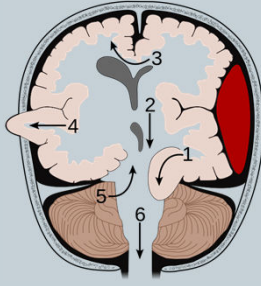

---

---

---

### Increased ICP

- Increased pressure due to an expanding hematoma in the brain (any growing mass).
- Brain begins to herniate
- Shift away from injury
- Follows path(s) of least resistance.
- Where it goes gives you the signs and symptoms

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Increased ICP Signs and Symptoms

- **Altered level of Consciousness**
  - Arouses to pain
  - Look at Glasgow Coma Scale (especially motor)
  - Posturing
    - ✦ Decorticate
    - ✦ Decerebrate
  - Frank Coma

These event may be rapid or slow!

- **Airway**
  - Patent
  - Needs adjunct
  - Prepare to tube
  - Maintaining the airway is imperative for any chance of survival.
    - ✦ Main indication for RSI in the field.

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

---

---

### Glasgow Coma Scale

Glasgow coma scale		
<b>Eye opening</b>	spontaneously	4
	to speech	3
	to pain	2
	none	1
<b>Verbal response</b>	orientated	5
	confused	4
	inappropriate	3
	incomprehensible	2
	none	1
<b>Motor response</b>	obeys commands	6
	localises to pain	5
	withdraws from pain	4
	flexion to pain	3
	extension to pain	2
	none	1
<b>Maximum score</b>		15

---

---

---

---

---

---

---

---

---

### Increased ICP Signs and Symptoms

- **Breathing**
  - Normal with slight elevated rate.
  - As they digress
    - ✦ Central Neurogenic Hyperventilation
      - Fast and Deep
    - ✦ Cheyne Stokes
    - ✦ Biots
    - ✦ Hypoventilation

- **Infringement on Medulla**
- **Method to compensate**
- **Hyperventilates to decrease PCO<sub>2</sub> (vasoconstrict)**

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

---

---

### Increased ICP Signs and Symptoms

- Breathing Continued
- Measure the End Tidal CO<sub>2</sub>.
  - Waveform capnography
  - Ventilate them to keep End Tidal CO<sub>2</sub> at **30mmHg**
  - **Never below 30mmHg**
- **Below 30mmHg could cause cerebral vasoconstriction and ischemia**

Figure 1: Normal Capnography Waveform

A-B: Respiratory baseline  
B-C: Expiratory upstroke  
C-D: Expiratory plateau  
D: End-tidal value

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

---

---

### Increased ICP Signs and Symptoms

- Circulation
  - Pulse will be slow (slowing down) 30 – 50 / minute
  - Bounding
  - Blood Pressure will be elevated (i.e. 200/110)
- Do not speed the pulse up or lower the B/P
- Due to the herniation, pressure is exerted on the medulla.
- Brain sends out signals to increase B/P because it is dying (sympathetic NS)
- Stimulation of Baroreceptors located in carotid arteries and aortic arch cause a parasympathetic response and slow pulse.
- Also pressure on medulla can slow pulse.

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

---

---

### Increased ICP Signs and Symptoms

- Pupils
  - Sluggish
  - Blown Pupil
    - ✧ Not Anisocoria (awake)
    - ✧ They are unconscious
  - Pressure on 3<sup>rd</sup> Cranial Nerve.

Closed Head Injury (2014)

---

---

---

---

---

---

---

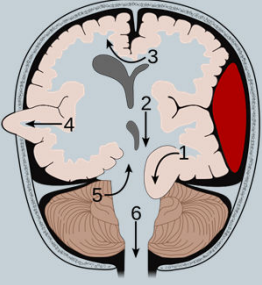

---

---

---

### Increased ICP What's Happening

- Increased pressure in skull from expanding hematoma.
- Pushing brain our foramen magnum.
- Pushing brain up and over.
- Patient dies.

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Treatment of Increased ICP

- Need to stop hemorrhage!
- So we blow off CO<sub>2</sub> to vasoconstrict.
  - BUT, when I do this I run the risk of cutting off blood flow to an already injured brain.
- Intubate, ventilate, capnography!
- Sux if you must!
- Keep at 30mmHg!

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Treatment of Increased ICP

- Pulse is Slow so leave it go!
- B/P is high, still alive!
- B/P low – no, no, no!
- Keep head of bed elevated 20 – 30 degrees if possible!
- Protect C-Spine!
- If B/P pressure is low (<100 systolic) you need to give fluids.
- No permission for permissive hypotension.

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Treatment of Increased ICP

- Get them to the right place ASAP.
- Minimal scene time for airway only!

Closed Head Injury (2014)

---

---

---

---

---

---

---

---

### Have a Great Day!
